

## aligner

### Features & Benefits

U-Aligners are a system that controls tooth movement and gradually aligns teeth without the use of metal wires or bracket. The aligners are made of strong plastic material and are fabricated to fit each patient's mouth. A series of aligners are made and are used step-by-step until desired tooth movement is completed.

U-Aligners are a great alternative for patients who want a straighter smile but do not want to wear traditional metal braces or for patients who have had orthodontic treatment in the past and want to make minor corrections to their smile. There are several advantages to using clear aligners.

- U-Aligners are removable so it is easier to keep clean and for you to brush and floss after meals
- The aligners allow for easier care for your gums
- U-Aligners are comfortable and less likely to irritate gums as well as your teeth
- Tooth wear from constant grinding can be prevented by using the aligners

### How it works

Aligners are worn for at least 20 hours each day to reach the desired maximum result. Each aligner is worn for 2 weeks before changing to the next one. The length of the treatment with aligners depends on the severity of each patient's case. Normally, aligner treatment can be as short as 2 weeks or up to one year. U-Aligner treatment time is shorter than traditional braces.
